my original intention was to write a history of medical statistics used in its prewar sense expanding the writings on the subject by major greenwood from which i formed many of my ideas in the early days immediately after the second world war in later years i decided that the scope of his works was narrower than what i think is appropriate now for he was writing in an era before the acceptance and use of the fisherian methods and he was probably not aware of the mathematization of many parts of biological theory further the boundary between the medical and biological sciences has largely disappeared many texts have now been written on branches of the theory and practice inspired by r a fisher see 4 13 i discuss the history of the use of quantitative methods in the biological sciences defined after the style of peller 1967 as that branch of science that uses a quantitative approach to or quantitative logical reasoning on or biology the mathematical tech any issue having to do with medicine niques are various and not classified here within the book i use biological sciences to include medicine but use the longer phrase in its title to avoid misunderstandings as to content moreover most of the experimental work carried out in medical research laboratories is performed on animals other than man

bringing together the viewpoints of leading ecologists concerned with the processes that generate patterns of diversity and evolutionary biologists who focus on mechanisms of speciation this book opens up discussion in order to broaden understanding of how speciation affects patterns of biological diversity especially the uneven distribution of diversity across time space and taxa studied by macroecologists the contributors discuss questions such as are species equivalent units providing meaningful measures of diversity to what extent do mechanisms of speciation affect the functional nature and distribution of species diversity how can speciation rates be measured using molecular phylogenies or data from the fossil record what are the factors that explain variation in rates written for graduate students and academic researchers the book promotes a more complete understanding of the interaction between mechanisms and rates of speciation and these patterns in biological diversity

interest in beetle conservation has long been evident with many papers treating these abundant ecologically important and popular insects however this issue of journal of insect conservation is the first to be dedicated entirely to beetles and it contains a number of papers predominantly from outside western europe to demonstrate the variety and scope of problems and conservation concerns that surround these insects a short introductory perspective is followed by eight original contributions in which beetles from many parts of the world are considered and in which some major threats to their wellbeing are evaluated
