le pilotage en temps réel des systèmes de production nécessite de prendre des décisions complexes sur l'affectation des ressources ou le choix des tâches à réaliser compte tenu de l'importance de la pertinence des décisions pour la performance d'un atelier le pilotage fait l'objet de travaux de recherche dont l'objectif est d'aider les preneurs de décision en particulier on ne sait pas évaluer les conséquences sur la performance d'une décision en temps réel car les bonnes performances résultent d'une séquence de décisions et non d'une seule de ce fait il est difficile d'établir quelle est la meilleure décision à prendre à un instant donné plusieurs auteurs ont utilisé la simulation pour apprendre des bonnes pratiques à l'aide d

approches d'apprentissage automatique mais se sont heurtés à la difficulté d'obtenir des exemples ou des observations sur des décisions en temps réel où la prise en compte des changements d'états est indispensable pour choisir des stratégies de production nous avons réussi à aborder ce problème en proposant une approche d'apprentissage à l'aide de réseaux de neurones qui ne nécessite pas d'exemples d'observations ni de connaissances d'experts préalables ce type d'apprentissage s'effectue par optimisation via simulation des paramètres du réseau de neurones par rapport à un objectif de performance du système il vise à extraire de façon autonome des connaissances sur la meilleure façon de décider d'un modèle de simulation nous montrons la faisabilité et l'apport de notre approche sur deux exemples inspirés de la littérature
