the universe would be a dull and dark place if the gaseous baryons did not cool collapse and form stars and galaxies however if this gas is allowed to cool unimpeded at the rate predicted from known atomic physics in the context of a well established cosmological model the gaseous matter would form stars and galaxies with a high efficiency so that far more than the observed fraction of about 10 15 of the baryonic matter would be found in luminous stellar systems therefore cooling must be damped or regulated by heating processes and observations show that this feedback is a widespread astrophysical phenomenon the place where this cooling and feedback manifests itself most dramatically is in the inner regions of the most massive dark matter halos found in our universe in the cores of galaxy clusters the effect of cosmic cooling in these objects was recognized in the mid 1970s and the term cooling flow was introduced by andy fabian and colleagues at cambridge as a possible explanation of the physical processes obtained in the central regions of clusters the name refers to the fact that gas cooling in the inner regions is associated with a loss of central pressure causing an inflow of hot gas from larger radii

clusters of galaxies are the largest and most massive collapsed systems in the universe and as such they are valuable probes of cosmological structure and galaxy evolution the advent of extensive galaxy surveys large ground based facilities space based missions such as hst chandra and xmm newton and detailed numerical simulations makes a particularly exciting time to be involved in this field the review papers in this volume span a comprehensive range of research in this area including theoretical expectations for the growth of structure survey techniques to identify clusters metal production and the intracluster medium galaxy evolution in the cluster environment and group cluster connections with contributions from leading authorities in the field this volume is appropriate both as an introduction to this topic for physics and astronomy graduate students and as a reference source for professional research astronomers

much of the pollution in the air water or soil results from discharges from industrial activities industrial practice can be significantly altered to reduce or eliminate the pollution if processes and products are so designed that either toxic materials are not used or processes are inherently less polluting this book is a collection of methods written by experts that would enable industry to design benign processes at the outset to achieve this purpose

the book reviews the present status of understanding the nature of the most luminous objects in the universe connected with supermassive black holes and supermassive stars clusters of galaxies and ultraluminous galaxies sources of gamma ray bursts and relativistic jets leading experts give overviews of essential physical mechanisms involved discuss formation and evolution of these objects as well as prospects for their use in cosmology as probes of the intergalactic medium at high redshifts and as a tool to study the end of dark ages the theoretical models are complemented by new exciting results from orbital and ground based observatories such as chandra xmm newton hst sdss vlt keck and many others
