in this book kipp martin has systematically provided users with a unified treatment of the algorithms and the implementation of the algorithms that are important in solving large problems parts i and ii of large scale linear and integer programming provide an introduction to linear optimization using two simple but unifying ideas projection and inverse projection the ideas of projection and inverse projection are also extended to integer linear optimization with the projection inverse projection approach theoretical results in integer linear optimization become much more analogous to their

linear optimization counterparts hence with an understanding of these two concepts the reader is equipped to understand fundamental theorems in an intuitive way part iii presents the most important algorithms that are used in commercial software for solving real world problems part iv shows how to take advantage of the special structure in very large scale applications through decomposition part v describes how to take advantage of special structure by modifying and enhancing the algorithms developed in part iii this section contains a discussion of the current research in linear and integer linear programming the author also shows in part v how to take different problem formulations and appropriately modify them so that the algorithms from part iii are more efficient again the projection and inverse projection concepts are used in part v to present the current research in linear and integer linear optimization in a very unified way

linear programming attracted the interest of mathematicians during and after world war ii when the first computers were constructed and methods for solving large linear programming problems were sought in connection with specific practical problems for example providing logistical support for the u s armed forces or modeling national economies early attempts to apply linear programming methods to solve practical problems failed to satisfy expectations there were various reasons for the failure one of them which is the central topic of this book was the inexactness of the data used to create the models this phenomenon inherent in most pratical problems has been dealt with in several ways at first linear programming models used average values of inherently vague coefficients but the optimal solutions of these models were not always optimal for the original problem itself later researchers developed the stochastic linear programming approach but this too has its limitations recently interest has been given to linear programming problems with data given as intervals convex sets and or fuzzy sets the individual results of these studies have been promising but the literature has not presented a unified theory linear optimization problems with inexact data attempts to present a comprehensive treatment of linear optimization with inexact data summarizing existing results and presenting new ones within a unifying framework
