several species of dinophysis produce one or two groups of lipophilic toxins okadaic acid oa and its derivatives or the dinophysistoxins dtxs also known as diarrhetic shellfish

poisons or DSP toxins and pectenotoxins. DSP toxins are potent inhibitors of protein phosphatases causing gastrointestinal intoxication in consumers of contaminated seafood. Forty years after the identification of *Dinophysis* as the causative agent of DSP in Japan, contamination of filter feeding shellfish exposed to *Dinophysis* blooms is recognized as a problem worldwide. DSP events affect public health and cause considerable losses to the shellfish industry. Costly monitoring programs are implemented in regions with relevant shellfish production to prevent these socioeconomic impacts. Harvest closures are enforced whenever toxin levels exceed regulatory limits. RLS *Dinophysis* species are kleptoplastidic dinoflagellates. They feed on ciliates *Mesodinium* genus that have previously acquired plastids from cryptophycean genera *Teleaulax*, *Plagioselmis* and *Geminigera* nanoflagellates. The interactions of *Dinophysis* with different prey regulate their growth and toxin production. When *Dinophysis* cells are ingested by shellfish, their toxins are partially biotransformed and bioaccumulated, rendering the shellfish unsuitable for human consumption. DSP toxins may also affect shellfish metabolism. This book covers diverse aspects of the abovementioned topics from the laboratory culture of *Dinophysis* and the kinetics of uptake, transformation and depuration of DSP toxins in shellfish to *Dinophysis* population dynamics, the monitoring and regulation of DSP toxins and their impact on the shellfish industry in some of the aquaculture regions that are traditionally most affected, namely northeastern Japan, western Europe, southern Chile and New Zealand.

Traditional agriculture and emerging biofuels technology produce a number of wastes and byproducts ranging from corn fiber and glycerin to animal manure that have the potential to serve as the basis for additional sources of bioenergy that includes both liquid biofuels and biogas. Biofuels from agricultural wastes and byproducts is the first book to focus solely on the production of biofuels primarily from agricultural waste and byproducts. The book is divided roughly into two sections. The first section looks at liquid biofuel production from agricultural byproducts, densification of agricultural residues and the delivery from farm to processing plant of waste and byproducts for use in biofuel

production the second section focuses on anaerobic digestion of food and animal wastes microbial diversity molecular and biochemical aspects of methanogenesis together these sections solidify biofuels from agricultural wastes and byproducts as a definitive source of information on the use of agricultural waste and by products in biofuel production
