in volume i we developed the tools of multivalued analysis in this volume we examine the applications after all the initial impetus for the development of the theory of set valued functions came from its applications in areas such as control theory and mathematical economics in fact the needs of control theory in particular the study of systems with a priori feedback led to the systematic investigation of differential equations with a multi valued vector field differential inclusions for this reason we start this volume with three chapters devoted to set valued differential equations however in contrast to the existing books on the subject i e j p aubin a cellina differential inclusions springer verlag 1983 and deimling multivalued differential equations w de gruyter 1992 here we focus on evolution inclusions which are evolution equations with multi valued terms evolution equations were raised to prominence with the development of the linear semigroup theory by hille and yosida initially with subsequent important contributions by kato phillips and lions this theory allowed a successful unified treatment of some apparently different classes of nonstationary linear partial

differential equations and linear functional equations the needs of dealing with applied problems and the natural tendency to extend the linear theory to the nonlinear case led to the development of the nonlinear semigroup theory which became a very effective tool in the analysis of broad classes of nonlinear evolution equations

mathematics of networks modulus theory and convex optimization explores the question what can be learned by adapting the theory of  $p$  modulus and related continuum analysis concepts to discrete graphs this book navigates the rich landscape of  $p$  modulus on graphs demonstrating how this theory elegantly connects concepts from graph theory probability and convex optimization this book is ideal for anyone seeking a deeper understanding of the theoretical foundations of network analysis and applied graph theory it serves as an excellent primary text or reference for graduate and advanced undergraduate courses across multiple disciplines including mathematics data science and engineering particularly those focusing on network analysis applied graph theory optimization and related areas features accessible to students with a solid foundation in multivariable calculus and linear algebra broad interdisciplinary appeal relevant to mathematics data science and engineering curricula numerous engaging exercises
