fourier methods in imaging introduces the mathematical tools for modeling linear imaging systems to predict the action of the system or for solving for the input the chapters are grouped into five sections the first introduces the imaging tasks direct inverse and system analysis the basic concepts of linear algebra for vectors and functions including complex valued vectors and inner products of vectors and functions the second section defines special functions mathematical operations and transformations that are useful for describing imaging systems among these are the fourier transforms of 1 d and 2 d function and the hankel and radon transforms this section also considers approximations of the fourier transform the third and fourth sections examine the discrete fourier transform and the description of imaging systems as linear filters including the inverse matched wiener and wiener helstrom filters the final section examines applications of linear system models to optical imaging systems including holography provides a unified mathematical description of imaging systems develops a consistent mathematical formalism for characterizing imaging systems helps the reader develop an intuitive grasp of the most common mathematical methods useful for describing the action of general linear systems on signals of one or more spatial dimensions offers parallel descriptions of continuous and discrete cases includes many graphical and pictorial examples to illustrate the concepts this book helps students develop an understanding of mathematical tools for describing general one and two dimensional linear imaging systems and will also serve as a reference for engineers and scientists

the field of intelligent systems and applications has expanded enormously during the last two decades theoretical and practical results in this area are growing rapidly due to many successful applications and new theories derived from many diverse problems this book is dedicated to the intelligent systems and applications in many different aspects in particular this book is to provide highlights of the current research in intelligent systems and applications it consists of research papers in the following specific topics l authentication identification and signature l intrusion detection l steganography data hiding and watermarking l database system and communication security l computer vision object tracking and pattern recognition l image processing medical image processing and video coding l digital content digital life and human computer interaction l parallel peer to peer distributed and cloud computing l software engineering and programming language this book provides a reference to theoretical problems as well as practical solutions and applications for the state of the art results in intelligent systems and applications on the aforementioned topics in particular both the academic community graduate students post doctors and faculties in electrical engineering computer science and applied mathematics and the industrial community engineers engineering managers programmers research lab staffs and managers security managers will find this book
