this book is intended as a continuation of my book parametrix method in the theory of differential complexes see 291 there we considered complexes of

differential operators between sections of vector bundles and we strived more than for details although there are many applications to for maximal generality overdetermined systems such an approach left me with a certain feeling of dissat faction especially since a large number of interesting consequences can be obtained without a great effort the present book is conceived as an attempt to shed some light on these new applications we consider as a rule differential operators having a simple structure on open subsets of rn currently this area is not being investigated very actively possibly because it is already very highly developed actively cf for example the book of palamodov 213 however even in this well studied situation the general ideas from 291 allow us to obtain new results in the qualitative theory of differential equations and frequently in definitive form the greater part of the material presented is related to applications of the l rent series for a solution of a system of differential equations which is a convenient way of writing the green formula the culminating application is an analog of the theorem of vitushkin 303 for uniform and mean approximation by solutions of an elliptic system somewhat afield are several questions on ill posedness but the parametrix method enables us to obtain here a series of hitherto unknown facts
