connecting databases to the world wide web is an increasingly important skill for computer scientists and mis bis as the www breaks down the traditional barriers of information sharing across organisations allowing this vital process to be done cheaply and efficiently traditional database books present database design with any material on web applications being a tackled later almost as an afterthought similarly web development books may gloss over databases in a single chapter on sql this book discusses database development but always in the context of the web thus it gives a genuine understanding of how to implement web databases rather than presenting one field and simply trying to bolt on the other afterwards that said it covers the core concepts of a traditional database design course and so offers the flexibility of learning database design separate from the web applications if desired scripting is covered first so that should the reader want to get the web context from the start they understand how their application will be implemented before trying to design it

advanced information technology is pervasive in any kind of human activity science business finance management and others and this is particularly true for database systems both database theory and database applications constitute a very important part of the state of the art of computer science meanwhile there is some discrepancy between different aspects of database activity theoreticians are sometimes not much aware of the real needs of business and industry software specialists not always have the time or the opportunity to get acquainted with the most recent theoretical ideas and trends as well as with advanced prototypes arising from these ideas potential users often do not have the possibility of evaluating the theoretical foundations and the potential practical impact of different commercial products so the main goal of the course was to put together people involved in different aspects of database activity and to promote active exchange of ideas among them

we are poised at a major turning point in the history of information management via computers recent evolutions in computing communications and commerce are fundamentally reshaping the ways in which we humans interact with information and generating enormous volumes of electronic data along the way as a result of these forces what will data management technologies and their supporting software and system architectures look like in ten years it is difficult to say but we can see the future taking shape now in a new generation of information access platforms that combine strategies and structures of two familiar and previously quite distinct technologies search engines and databases and in a new model for software applications

the search based application sba which offers a pragmatic way to solve both well known and emerging information management challenges as of now search engines are the world s most familiar and widely deployed information access tool used by hundreds of millions of people every day to locate information on the but few are aware they can now also be used to provide precise multidimensional information access and analysis that is hard to distinguish from current database applications yet endowed with the usability and massive scalability of search in this book we hope to introduce search based applications to a wider audience using real case studies to show how this flexible technology can be used to intelligently aggregate large volumes of unstructured data like pages and structured data like database content and to make that data available in a highly contextual quasi real time manner to a wide base of users for a varied range of purposes we also hope to shed light on the general convergences underway in search and database disciplines convergences that make sbas possible and which serve as harbingers of information management paradigms and technologies to come table of contents search based applications evolving business information access needs origins and histories data models and storage data collection population data processing data retrieval data security usability performance cost summary evolutions and convergences sba platforms sba uses and preconditions anatomy of a search based application case study gefco case study urbanizer case study national postal agency future directions

gerald postâ s database management systemstakes an introductory approach to developing database applications teaching students to evaluate a business situation and then build and design a database application from systems design to distribution and integration of the system and everything in between students will gain knowledge by getting a hands on experience the third edition has been revised to offer a more flexible way to deliver database management application post continues to have a textbook that covers the core theories and ideas of database management now it offers two different workbooks depending on the software that the instructor utilizes one workbook covers oracle and the other workbook covers access thus allowing the instructor to pick the workbook that will be employed in the course and to go more â in depthâ with either tool the book can also be used as a standalone thus having the professor chose what software will be utilized in teaching this course
